

# Case Study

**Project:** Dealer Parts Distribution Centre **Location:** Bristol

This being the third Parts Distribution Centre sde had been involved with for this customer. Having successfully completed sites in Barking and Normanton, sde were asked to design a storage solution to store £1.8million of stock.

The stock ranges from basic car parts i.e. lamps, clutches, filters, to the more obscure objects such as car bumpers, body panels and engines.

Due to the height of the building a conventional mezzanine floor was not possible, so a two tier floor was proposed with walkways either side that were lower than the floor to enable pickers to be able to safely walk under the low level concrete beams. On the first floor the shelving was carefully designed to fit directly under the concrete beams to maximize the storage within the unit.

Having given the green light to proceed, sde finished the project 7 days early, leaving the customer additional time to stock up the new site.
